

Adapter Lens Mounts

Van Diemen have made lens adapters with optical compensation and conversion for many

Video as well as film applications. The initial impetus for these products came from the Wild Life Cinematographers who were always looking for ways to get different views of the world around us and its various inhabitants. This was an opportunity for us to produce special optics for telephoto applications, range extenders and photographic lens conversions, for underwater applications aspheric wide angle lens adapters and indeed camera housing for underwater use. We also became involved with Macro lens manufacture for wild life and other used re-mounting Leica and Cooke lenses making macro focus operations much easier.

In the Video field Van Diemen make adapters to convert lenses designed for one format to work effectively on cameras of a different Format i.e 2/3" chip to 1/2" chip size. Enquiries for special optical work are always welcome.
